

CONSUMER SENTIMENT INDEX, JULY 2014

Consumer Sentiment increases in July

Consumer sentiment increased in July to 89.4, from 81.1 in June. The 3-month moving average rose to 83.3 from 82.6 in June.

The Consumer Sentiment Index comprises two sub-indices; an index of consumer expectation that focuses on how consumers view prospects over the next 12 months and an index of current economic conditions, focusing on consumers' present situation.

The Index of Consumer Expectations is based on consumers' perceptions of their future financial situation, their economic outlook for the country as a whole and employment expectations. This sub-index rose to 79.9 this month, from 71.2 in June.

The Index of Current Economic Conditions is based on how consumers feel about their current financial circumstance compared to 12 months ago, as well as their perception of the current buying environment for large household purchases. The Index of Current Economic Conditions rose to 103.5 from 95.8 in June.

The Consumer Sentiment Index, the Index of Consumer Expectations and the Index of Current Economic Conditions remain at levels equal to the first half of 2007.

Note: Since May 2008 the KBC Bank Ireland/ESRI Irish consumer sentiment survey was prepared using a slightly different methodology. While this may have a minor impact on the precise numerical estimates of various survey components, it should not have any significant effect on the broad trends reported.

The data was obtained from telephone interviews during the first two weeks of the month with around 800 completed questionnaires. The data were re-weighted in line with gender, age and level of educational attainment to ensure the data is fully representative of the national population of adults. Each index is calculated by computing the relative scores (the percent giving favourable replies minus the percent giving unfavourable replies (the balance), plus 100) for each question used in the different indices. Those who reply “Don’t Know”, “Remain the same” are excluded from the index calculations. Each relative score is rounded to the nearest whole number. The sum of the relative scores is then divided by the base period total for each index.
